In three dimensional graphics applications, an object to be displayed on a display device may be represented by a plurality of polygons, or flat polygons, such as triangles. In three dimensional rendering applications, these polygons may be arranged into a polygon mesh. A polygon mesh may be used to approximate a three-dimensional surface and is typically composed of a plurality of convex polygonal faces that form a surface. Graphics processing systems may include graphics processing units (GPUs) that are designed to render graphical objects in response to read and/or write operations received from a graphics application that is executing on a computing system. The GPUs may include a plurality of hardware accelerators, known as shader cores, that are programmed to execute programs, or shaders. Shaders are typically programs written in a shader language that compiles, or converts, the shaders into a set of programmable instructions that a GPU may execute to define the graphical object to be rendered. A vertex shader or geometry shader is used to manipulate the vertices of a polygon, while a pixel shader or fragment shader is used to manipulate the colors of the individual pixels that comprise a rendered graphical object. GPUs may further include a texture unit that may be used to process texture information to be applied to the graphical object. Further, for complex applications, the GPUs may include multiple shader stages that each may implement a type of shader. A GPU may be used to render a plurality of graphical objects, and may be used to perform rendering operations for each graphical object concurrently. To increase the overall rendering performance, the graphics application may issue multiple commands requesting the rendering of one or more graphical objects at a time. However, in some cases, the graphics application may request that the GPU render graphical objects that are not yet fully defined in order to better exploit the rendering performance of the GPU. The application may have to repeat certain rendering operations, for example the receiving or processing of vertex and/or geometry commands, until a predefined set of vertices is received for a polygon. The following description will be discussed in relation to the generation of triangles, but it should be understood that the description is merely an example and that the triangle generation process may be used to generate any type of polygon structure. When a triangle is rendered, a vertex shader program may be executed on a vertex shader core to define the triangle. An application may then request that a GPU render the triangle. As is illustrated in FIG. 1, a triangle may be defined using one or more vertices

Another brush tool is the Smudge Brush. Its most useful features are the Automatic (or Smudge) Tool which works similar to a rubber stamp, and the Magnetic Stylus which moves with the brush. The Pen Tool allows you to draw lines and circles on the image. There are also several brush tip presets. Some of the most useful include: You can create a Brush Preset by clicking the Brush Tool icon in the Toolbox, then going to the Brush Preset Options... menu. Under Preset Brush Type, choose between Paintbrush, Inkjet, Pencil, or No Brush. You can save Brush Presets and make them available to all Photoshop documents. To do this, you can go to the Brush Preset panel on the Brush Tool Options... menu. If you choose to see the Brush Presets, the Brush Presets tab opens up. You can browse or create your own Brush Presets. You can also make settings that apply to all Photoshop documents by going to the Preferences... menu in Photoshop. Then click on General. Click on the Brush Presets... tab. Here you can set whether the Brush Tool automatically switches to a brush tip preset, and the auto-dispensing frequency of a brush tip preset. You can save the Brush Presets that you use for several documents. To do this, go to the Brush Preset panel, select the checkbox next to the preset that you want to save, then click on the Edit... button. A dialog box opens. To save the preset for all documents, click on the... button next to the Preset folder. To save a brush preset for a

specific document, click on the... button next to the Preset folder. In the dialog box, enter a new file name and select a location to save the preset to. For example, if I wanted to save the Brush Preset to the desktop for all my documents, I would enter desktop.pibr_ for the name, and C:\ for the path. You can also save a custom path in your photoshop documents. For more information on brush tip preferences, refer to Adobe's Documentation: More Photoshop features: Open up the Photoshop Help. On a Mac, this is found by opening the Help menu and choosing Photoshop Help. On Windows, it is found by opening the Help menu and choosing Photoshop Help.
